

VERIQO -- CORE TRUST KERNEL FREEZE FOR COMMERCIALIZATION

Response to Tubtaskan_semua_secara_details.docx item 1 (PRIORITAS UTAMA -- FREEZE CORE). Effective as of commit aa010ed on branch claude/l99-gap-coverage-nv70zy, the packages listed below are FROZEN FOR COMMERCIALIZATION. This is a declared engineering policy for the remainder of the Commercialization Sprint, not a Go language mechanism -- there is no compiler enforcement, only this document and the discipline of every round that follows it.

WHAT "FROZEN" MEANS

Allowed on frozen packages:

- Bug fixes (an incorrect result for a documented, intended input)
- Security fixes (a genuine vulnerability, not a hardening preference)
- Integration fixes (a wiring/adaptor problem where a frozen package's own real, existing API is being called incorrectly by new commercial-layer code -- e.g. the DecideClaim/AuthorizeExecution wiring already completed in the prior round)
- Test hardening (more coverage of EXISTING behavior; never a new invariant that changes behavior)
- API stabilization (freezing wire-format compatibility, deprecation notices; never breaking an existing exported signature without a compelling security/correctness reason)
- Documentation

NOT allowed on frozen packages:

- Architecture redesign for elegance, DX, or "cleaner code" alone
- New abstractions with no concrete commercial-layer caller
- Changing a sealed type's field set, hash input, or verification algorithm (this would silently invalidate every already-anchored Decision/ActionAuthorization/manifest hash in any deployment)
- Adding new exported mutation surfaces to any sealed type

FROZEN PACKAGE LIST

Area (reviewer's own naming)	Package(s)
---	---
Decision Trust Boundary	pkg/insurance/decision
ActionAuthorization	pkg/insurance/action
Insurance Decision integration	pkg/insurance/api (Facade.DecideClaim and everything it wires), pkg/insurance/claimworkflow
Workflow DAG	pkg/workflow
Trust Calculus	pkg/moat/decision, pkg/moat/intelligence/risk, pkg/trust, pkg/trust/state
Evidence foundations	pkg/evidence/manifest, pkg/insurance/evidence, pkg/insurance/causation, pkg/insurance/cre, pkg/insurance/finding
Knowledge foundations	pkg/inference, pkg/governance/lifecycle
Intelligence foundations	pkg/moat/intelligence/*
DARI guarantees (Deterministic, Auditable, Replayable, Immutable)	pkg/platform/audit (Merkle/checkpoint/anchor), pkg/canonical/jcs (canonicalization)
Deterministic execution	pkg/execution, pkg/lifecycle
Ledger primitives	pkg/platform/audit
Existing authorization controls	pkg/platform/security, pkg/authz

Everything the Commercialization Sprint builds from this point forward is additive: new packages under a pkg/commercial/ tree, new cmd/ binaries, and new, separately-versioned HTTP routes -- calling into the frozen list above through its existing, real, tested public

API, never reaching into its internals or duplicating its logic. This mirrors the exact "additive, non-disruptive" precedent this engagement's own gateway routes (/lifecycle/run_unified, /insurance/decide) already established.

WHY THIS MATTERS NOW

The reviewer's own framing: VERIQO does not need to be "perfect" to find a pilot customer. Every round up to this one hardened the trust kernel's own internal correctness. The Commercialization Sprint's job is to make that kernel externally reachable, demonstrable, and defensible -- not to keep making it more internally elegant. A frozen kernel with an honestly-scoped commercial surface beats an ever-expanding kernel with no external interface at all.
