

MIP-001 — Master Implementation Plan, mapped to this repository

Status: W0 Architecture Freeze — COMPLETE **Purpose:** the §37 Agent Handoff artifact. Current state → target state → gap, per wave, against the code that actually exists.

MIP §32 rule 1 is "*inspect existing repository first*" and §7 forbids creating a duplicate engine for a capability an existing primitive can carry. This document is that inspection.

1. Wave status summary

Wave	Scope	Status
W0	Architecture freeze	COMPLETE — 7 documents, this round
W1	Canonical evidence state	SUBSTANTIALLY PRE-EXISTING — pkg/evidence/manifest (FROZEN), pkg/commercial/evidencfabric
W2	IEAP acquisition fabric	PARTIAL — contracts exist, simulated sources only; rights-before-contact is constitutional but ungated in the absence of a live connector
W3	Provenance / integrity / custody	SUBSTANTIALLY PRE-EXISTING — three lineage dimensions specified this round; custody FSM and hash chain pre-existing
W4	Epistemic qualification fabric	BUILT THIS ROUND — 5 new packages + 3 pre-existing
W5	Neutral Evidence Protocol	PARTIAL — dissent + symmetry built; Case Constitution object designed only
W6	Disclosure / privilege / PO	BUILT THIS ROUND — P/C model, purpose rights, controlled view, PO
W7	Redaction assurance	DESIGNED — state machine + assurance record specified; media workers not built
W8	Independent verifier / replay	PRE-EXISTING — cmd/veriqo-commercial-verify, pkg/replay
W9	AI / Aureum / God of EYS	GATEWAY BUILT, intelligences not built
W10	Dark web intelligence	NOT BUILT — blocked on acquisition legal review
W11	Domain intelligence	PARTIAL — insurance/maritime substantial; others contract-only
W12	Common Fact Pack	PARTIAL — Evidence Dossier v1 is a subset; full 25-section pack not built
W13	Production qualification	NOT DONE — 8 external blockers, all READY_FOR_REAL_QUALIFICATION

2. W4 — what was built and why it was missing

The scan that opened this round found **zero** files matching reverseproof, OBSERVED_ABSENT, nextbest, SingleSourceException, ControlledView, AIContribution, ProtectiveOrder, constitution, or EventEnvelope.

That is the honest gap: VERIQO had trust calculus, contradiction, and dependency analysis, but not the epistemic frame that makes them answerable — no reverse proof to say what evidence *should* exist, and no observability gate to distinguish "absent" from "we didn't look."

New packages, each extending rather than replacing:

Package	Extends	Does not duplicate
pkg/constitution	— (new authority-free checker)	Emits no events, holds no state
pkg/contract/event	pkg/platform/audit chain semantics	Adds no second ledger
pkg/qualification/reverseproof	pkg/insurance/causation hypotheses	Does not re-implement hypothesis sets
pkg/qualification/observability	—	Distinct from pkg/blockers/coverage (ops coverage, not epistemic)
pkg/qualification/independence	pkg/insurance/evidence/dependency.go concepts	Canonicalizes across 15 dimensions rather than forking
pkg/qualification/state	pkg/insurance/evidence/qualification.go	Adds the canonical 9-state vocabulary + single-source exception
pkg/qualification/nextbest	—	Pure ranking over policy-filtered candidates
pkg/disclosure/access	pkg/authz purpose binding	Adds the two-dimensional P/C lattice authz lacked
pkg/ai/gateway	pkg/authz, pkg/disclosure/access	Composes them; adds no policy engine

3. The anti-duplication audit

Per §7, for each capability the MIP names, the question "*does this already exist?*" was answered before writing code:

MIP capability	Answer	Action taken
Event ledger	pkg/platform/audit — hash-chained, Merkle, verified	Extended with a canonical envelope. No new ledger.
Policy plane	pkg/authz — purpose binding, policy decisions	Extended with disclosure lattice. No new policy engine.
Trust calculus	pkg/core/trustcalc	Reused. Independence gate added alongside, not inside.
Contradiction	pkg/insurance/contradiction	Reused.
Hypothesis	pkg/insurance/causation	Reused by reverse proof.
Retention / legal hold	pkg/governance/data	Reused.
Replay	pkg/replay, Store.Replay	Reused.
Verifier	pkg/commercial/packageverify	Reused.
Canonicalization	pkg/canonical/jcs	Reused by the event envelope hash.

Forbidden engines from §7 — AuditEngine, DissentEngine, NeutralityEngine, ProtectiveOrderEngine, ProvenanceEngine, DisclosureEngine, RedactionEngine — **none were created**. Those capabilities are expressed as canonical state + policy + ledger events, exactly as §7 requires.

4. Definition of Done, applied honestly

MIP §33 requires fifteen conditions. Applied to this round's new packages:

Condition	W4 packages	AI gateway	Disclosure
Contract exists	✓	✓	✓
Implementation exists	✓	✓	✓
Policy exists	✓	✓	✓
Authorization exists	✓	✓	✓
Persistence exists	— via existing ledger	—	—
Ledger events exist	envelope defined; emission wiring partial	✓ contribution record	✓ decision record
Hashing exists	✓	✓	✓
Replay exists	pre-existing fabric	—	—
Negative tests	✓	✓	✓
Adversarial tests	✓	✓	✓
Race tests pass	✓	✓	✓
Tenant isolation	inherited from Store	✓	✓
Failure behavior defined	✓ fail-closed	✓ fail-closed	✓ fail-closed
Documentation	✓	✓	✓
Independent verification possible	✓ constitution checks are pure functions	partial	partial

Rows marked partial are partial. Per §34, no capability in this round is reported above `ADVERSARIAL_TESTED`, and none is reported `EXTERNALLY_VALIDATED` or `PRODUCTION_QUALIFIED`.

5. Status taxonomy for the whole platform

Per §34 — never `DONE` without a level:

Canonical evidence state	IMPLEMENTED · ADVERSARIAL_TESTED · REPLAY_VERIFIED
Ledger	IMPLEMENTED · ADVERSARIAL_TESTED · REPLAY_VERIFIED
Constitution (executable)	IMPLEMENTED · UNIT_TESTED · ADVERSARIAL_TESTED
Event envelope	IMPLEMENTED · UNIT_TESTED
EQF (5 new components)	IMPLEMENTED · UNIT_TESTED · ADVERSARIAL_TESTED
Disclosure P/C + PO	IMPLEMENTED · UNIT_TESTED · ADVERSARIAL_TESTED
AI evidence gateway	IMPLEMENTED · UNIT_TESTED · ADVERSARIAL_TESTED
Independent verifier	IMPLEMENTED · INTEGRATION_TESTED
Replay	IMPLEMENTED · REPLAY_VERIFIED
IEAP acquisition	DESIGNED (contracts IMPLEMENTED, sources SIMULATED)
Redaction assurance	DESIGNED
Common Fact Pack	DESIGNED (Dossier v1 IMPLEMENTED as a subset)
Aureum / God of EYS	DESIGNED
Dark web	DESIGNED
ZKP	DESIGNED
Everything external	READY_FOR_REAL_QUALIFICATION, never QUALIFIED

6. Claims that must not be made (§38)

- Not `PRODUCTION_QUALIFIED` — eight external blockers stand.
- Not "AI-governed evidence" — the gateway constrains AI; no AI has evidence authority, by construction.
- Not "dark web integrated" — no acquisition path exists.
- Not "redaction verified" — no media worker exists to verify.
- Not "Common Fact Pack shipped" — Dossier v1 is a subset of the 25-section specification.

- Not "independent corroboration" for any same-root or UNKNOWN dependency pair.
- Not "MLETR-qualified" — a legal opinion this engagement cannot produce.
