

VERIQO Canonical Vocabulary — FROZEN

Status: FROZEN. Amendments require an explicit vocabulary amendment, not a new document. **Executable form:** `pkg/assurance/fabric.go` · asserted by `pkg/assurance/fabric_test.go`

1. Why this document exists

By this round VERIQO's own documents used all of these terms, each meaning roughly one of five things:

Unified Evidence · Evidence Fabric · Evidence Engine · Trust Engine · Trust Kernel · Knowledge Fabric · Intelligent Fabric · Intelligence Layer · Qualification · EQF · Case lineage · Workflow · Case Engine · Orchestrator · Execution

Left alive, that list guarantees an engineer, an investor, a reviewer and the next agent each read a **different architecture** out of the same repository. That is not a documentation problem. It is how a system acquires four implementations of one idea.

The vocabulary is therefore frozen to **five fabrics**, each with exactly one canonical name, and every term above is retired to one of them.

2. The five fabrics

Fabric	Full name	What it is for
TECP	Trust & Evidence Control Plane	Hold the canonical state of evidence, who may touch it, and what was done to it
EQF	Epistemic Qualification Fabric	Decide what the evidence supports, what it does not, and what is missing
IF	Intelligent Fabric	Propose explanations. Intelligence proposes; it never concludes
CRF	Case Resolution Fabric	Hold one case across every domain, from identity to outcome
FREF	Forward–Reverse Execution Fabric	Run both directions over the same evidence, and prove they close

Composition

①	TECP	Identity · Trust · Evidence · Provenance · Authority · Policy · Audit · Ledger
②	EQF	Qualification · Independence · Contradiction · Reverse Proof · Proof Obligations · Next Best Evidence · Uncertainty
③	IF	Knowledge · Reasoning · Causal · Bayesian · Counterfactual · Temporal · Economic · Digital Twin
④	CRF	Case · Mission · Intent · Hypothesis · Claim · Evidence · Timeline · Finding · Resolution · Outcome
⑤	FREF	FORWARD Observation → Evidence → Knowledge → Reasoning → Trust → Finding → Decision REVERSE Decision/Claim → Proof Obligations → Required Evidence → Evidence Gap → Contradiction → Qualification → Next Best Evidence

3. The five are not five packages

This is the load-bearing rule and it is enforced by test.

Creating `pkg/tecp`, `pkg/eqf`, `pkg/if`, `pkg/crf` and a `pkg/fref` engine would have violated the anti-duplication rule the architecture sets for itself: five new façades over capabilities that already exist, and five more places for a

second implementation to hide.

A fabric is therefore a **claim about existing code**, audited along eleven dimensions. `TestNoFabricHasItsOwnPackage` fails the build if `pkg/tecp`, `pkg/eqf`, `pkg/crf`, `pkg/intelligentfabric`, `pkg/trustengine` or `pkg/caseengine` ever appears.

`pkg/fref` is the single exception, and deliberately so: it is a **contract** that refuses out-of-order executions, not an engine that runs them. It owns no stage — every one of its fourteen stages names another package as the authority, and `VerifyAgainstContract` reports a stage that ran anywhere else as drift.

4. Retired vocabulary

Each retired name has exactly one canonical replacement. `TestEveryRetiredSynonymHasExactlyOneReplacement` fails if any name maps to two fabrics — that would not be a retirement, only a new ambiguity.

Retired name	Canonical fabric
Unified Evidence	TECP
Evidence Fabric	TECP
Evidence Engine	TECP
Trust Engine	TECP
Trust Kernel	TECP
Qualification (as an architecture layer)	EQF
EQF (as a package name)	EQF (the fabric)
epistemic layer	EQF
Knowledge Fabric	IF
Intelligent Fabric	IF
Intelligence Layer	IF
moat	IF
Case Engine	CRF
Case Resolution Engine	CRF
Case lineage	CRF
case workflow	CRF
Orchestrator	FREF
Execution	FREF
universal workflow	FREF
pipeline	FREF

"**Trust Kernel**" deserves a note. It named something real — the frozen core in `docs/VERIQO_CORE_TRUST_KERNEL_FREEZE.md` — and that freeze declaration stands. What is retired is the *term* as an architecture-level name, because it competed with "Trust Engine" and "Evidence Fabric" for the same territory. The frozen core is part of TECP.

5. How to use this

- **Naming a new package:** it belongs inside one of the five fabrics. If it appears to need a sixth, that is a vocabulary amendment, argued explicitly.
- **Writing a document:** use the canonical name. If you reach for a retired one, the table above says what you meant.
- **Reviewing a claim:** ask which fabric, then read that fabric's row in `docs/architecture/FIVE_FABRIC_CAPABILITY_AUDIT.md`, which names the entry point, the call graph and the fail-closed behaviour you can check.
